Biankin said “We are now closer to being distinct clinical characteristics and Pancreatic Cancer each with their own has identified four key subsets of survival rate of less than 5%.

Current methods of treating pancreatic – currently the fourth leading cause of Cancer, offering new opportunities reclassification of Pancreatic Researchers at the University of breakthrough in Glasgow Director of the Institute of Cancer Sciences Professor Jeff Evans Thank you more about the work of our scientists and how your donations make a difference.

Glasgow has a great deal to be proud of in cancer science and each year we make significant progress in translating our knowledge of basic science and cancer biology into new treatments and improved patient care. Charitable donations play an important part in this.

Over the past year, your donations to the Beatson Pebble Appeal have helped us to develop an electronic data capture system which will speed up the process of collecting and validating data in clinical trials. Your donations have also helped us to recruit world leading scientists who are helping to identify biomarkers with the aim of improving earlier diagnosis and developing more precise and effective treatments for patients.

I was delighted to present at a Beatson Pebble Appeal Public Lecture last year and I hope you will join us at our lectures and open days in 2016. They are a great opportunity to hear more about the work of our scientists and how your donations make a difference.

Thank you

Professor Jeff Evans
